

Research position for an MSc/PhD student is available to study Interactive mechanisms of mineral dissolution by a microbial consortia

Essential metabolic functions within ecosystems are often partitioned among various members of microbial communities that each benefit the whole population. In this study, we aim to elucidate the genetic and molecular basis of a symbiotic relationship between heterotrophic bacteria and a photosynthetic diazotroph, *Trichodesmium*.

The research involves computational analysis of omics experiments (bioinformatics) and will be centered in Haifa and Jerusalem.
